

SCRAWL

Draw your futures. Sketch the next 60 seconds of SOL, stake it on Solana, get scored on every move.

SOLANA MOBILE HACKATHON / MOBILE TRACK / ANDROID / DEVNET

THE PROBLEM

PERPS LOOK LIKE A COCKPIT. MOST PEOPLE NEVER TRY ONE.

Order books

Limit, stop, reduce-only. Three tabs before you place a bet on a price.

Liquidation maths

Margin, funding, maintenance. A wrong number and the position is gone.

Built for a desk

Tiny charts and dense tables, on a screen you hold in one hand.

Phones are where people already have a wallet and a minute to spare. Nobody has made a market view that is native to that.

THE IDEA

A FUTURES TRADE, EXPRESSED AS A DRAWING.

1

Draw

Trace where you think SOL goes over the next minute, with your finger.

2

Stake

Pick 0.01 SOL or more and leverage up to 100x. Approve once in your wallet.

3

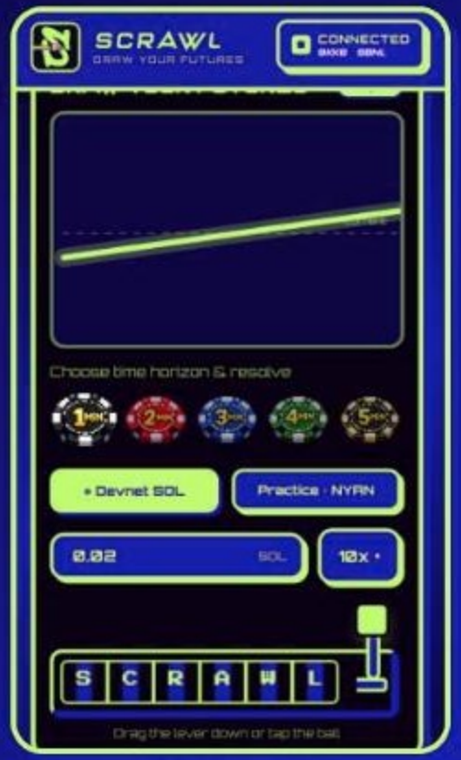

Score

Every second's move is checked against your line. Call the direction right more than half the time and you profit.

No order types, no liquidation price, no guessing where to click. One gesture, one minute, one number.

THE APP / CAPTURED ON A PHONE, DEVNET

DRAW. WATCH. SETTLE.

DRAW & PULL

WATCH THE CLOCK

SETTLED ON-CHAIN

HOW A ROUND IS SCORED

DIRECTION, SECOND BY SECOND.

The round has 60 samples, one per second. At each step we compare which way your line moved with which way the real price moved. Steps where the price did not tick are skipped.

```
accuracy = right calls ÷ compared steps
PnL = (2 × accuracy − 1) × max profit
max profit = |price move| × stake ÷ start price × leverage
```

Loss is floored at your stake. Fee is 2% of profit only.

EXAMPLE / ILLUSTRATIVE

Stake	0.50 SOL at 10x
SOL move	$109.00 → $109.05
Max profit	0.0025 SOL
Accuracy	70%
PnL	+0.0010 SOL

The pink mark is 50%: break-even. Right of it you win, left of it you lose.

BUILT FOR SOLANA MOBILE

THE WHOLE LOOP FITS IN A THUMB AND A MINUTE.

Mobile Wallet Adapter 2.0

Connect, authorize and sign through the wallet already on the phone. The auth token is cached in secure storage and refreshed silently.

Sign here, submit from the app

The wallet only signs. The app checks what came back (only fee instructions may be added), then sends it through its own RPC.

Made for a small screen

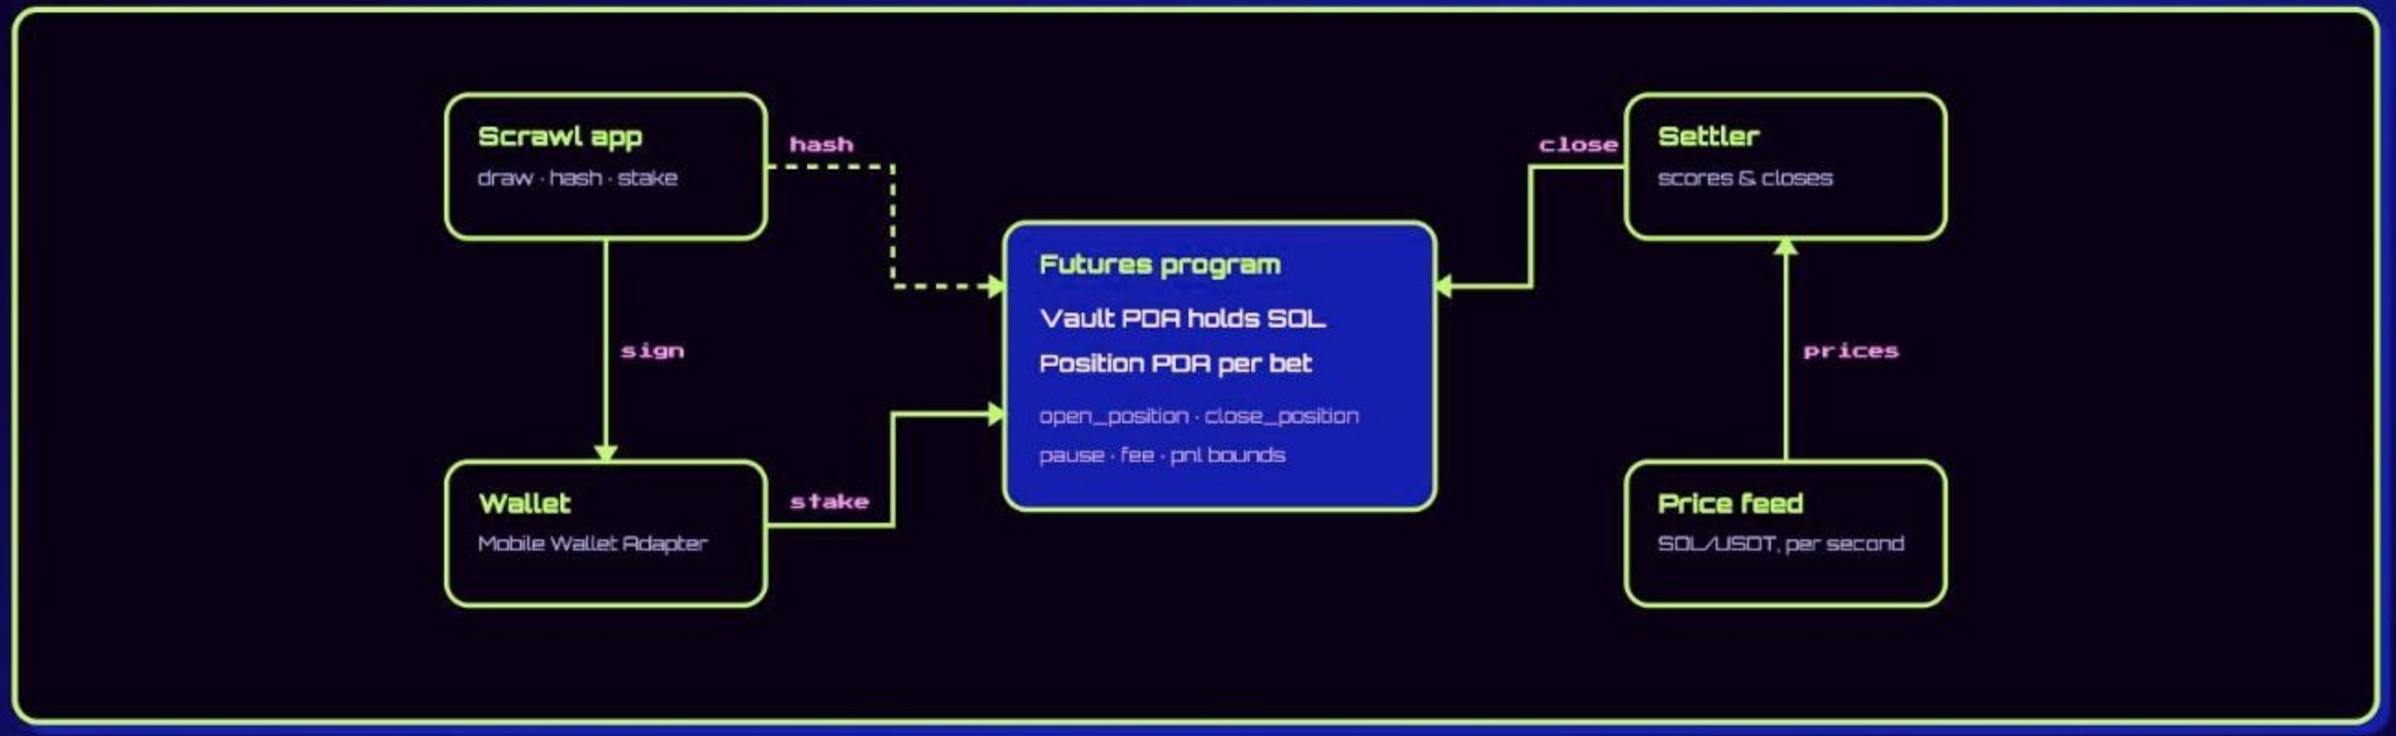

A finger-drawn canvas, a slot-machine lever, haptics on every pull and result, and the screen stays awake during a round.

Wallet errors that make sense

Backing out of the wallet is a retry, not a failure. A fresh blockhash is fetched after approval so devnet's short expiry does not bite.

ON-CHAIN DESIGN

STAKES IN A VAULT. RESULTS WRITTEN BY A SETTLER.

Program	FYHebuyTZwg2JWaHTHtRY7xCYgEHpiX1Frq9SAwzkhtu
Cluster	Solana devnet
Stack	Anchor program · Node settler · Expo / React Native app

TRUST MODEL

WHAT IS CHECKED, AND WHAT IS STILL TRUSTED.

Enforced on-chain

- Only the settler key can close a position, and only after 60 seconds
- PnL is bounded to between your stake lost and stake × leverage
- The drawing's hash is stored before the round starts; a different drawing is rejected
- Fee on profit only, pause switch, a vault that cannot go below rent

Trusted today

- The settler records prices from a public exchange feed and scores the round
- One settler key, held off-device
- Emergency withdraw exists, as a demo-stage switch

Next: read prices from an on-chain oracle so the score can be checked by anyone.

WHY PEOPLE COME BACK

ONE MINUTE AT A TIME. EASY TO DO TWICE.

A loop you can finish on a bus

Every position is 60 seconds. Stack up to five back to back with one approval.

Streaks and a daily bonus

Play on consecutive days to build a streak and claim play currency.

Practice with NYAN

No wallet or funds needed to learn the feel. Switch to devnet SOL when ready.

PICK YOUR HORIZON

A 3-minute pick is three 60-second positions, staked in one transaction and settled one by one.

WHERE IT STANDS

WHAT HAS BEEN RUN, AND WHAT HAS NOT.

- DONE — Anchor program deployed to devnet, with 19 passing tests covering every instruction and failure path
- DONE — Settler verified end to end on devnet: stake, drawing registered, scored, position closed, tampered drawing rejected
- DONE — Full rounds played on a physical Android phone with a real wallet, stake and payout visible on the explorer
- NEXT — Multi-minute batches and a winning-payout round on device
- NEXT — Release APK with an https settler so anyone can install and play
- NEXT — A shared leaderboard read from program events (today it is on the device)

ROADMAP

FROM A ONE-PHONE DEMO TO A GAME PEOPLE SHARE.

NOW

Hackathon build

- Release APK
- Demo video
- Hosted settler

NEXT

Fair and social

- On-chain price oracle
- Global leaderboard
- Push for settled rounds

LATER

Open game

- More assets and timeframes
- Seasons and rewards
- Verified app identity in wallets

SCRAWL

DRAW. STAKE. GET SCORED.

A futures game that fits in one thumb, on Solana Mobile.
